Boundary 6.5 EC Herbicide Labeled on Potatoes

By William Stall, Professor, UF/IFAS, Horticultural Sciences

Boundary herbicide is a premix herbicide of s-metolachlor and metribuzin. The product contains 5.25 lbs of s-metolachlor and 1.25 lbs of metribuzin per gallon. Boundary is labeled for preemergence weed control and may be applied after planting but before potato emergence. This includes after drag-off. Do not incorporate the herbicide.

Preemergence application rates for use in sandy soils are 1.5 to 2 pints per acre. In Florida sandy soils do not apply over 1.5 pts product or crop injury may occur.

A post emergence application may be made, but in center pivot irrigation water only.

There are precautions for post emergence applications only to russetted and white skinned varieties that are not early maturing. Post emergence applications to Atlantic variety are precautioned against. Control from preemergence applications will control many broadleaf and grass weeds. Yellow nutsedge is also controlled.
