Chateau Herbicide Labels for Row Middles

By William M. Stall, Professor and Extension Horticulture Specialist, Horticultural Sciences Department

Chateau (flumioxazin) has received labels through TPR, Inc. (Third Party Registrations, Inc.) for preemergence and postemergence weed control between rows of transplanted or seeded fruiting vegetable crops, okra and crops in the melon 9-A subgroup (cantaloupes, and watermelons) grown using the raised-bed plastic mulch production system.

Approved Crops Include:

- Fruiting vegetables: tomato, pepper (bell and non bell), eggplant, pepino, tomatillo and okra.
- Melons: citron melon, muskmelons and muskmelon hybrids and/or cultivars (such as cantaloupe, casaba, honeydew, etc.), and watermelon.

Chateau may be applied at 4 oz per treated acre as a shielded or hooded application to row middles after plastic is laid up to transplanting/seeding. Transplanting/seeding can take place anytime after spray has dried. Spray must be applied to the row middles and contact no more than the bottom inch of the side of the raised bed. If the top of the mulched beds (where plants are to be transplanted) is contacted, severe injury can occur because of foliage contact with treated plastic.

Chateau provides preemergence residual control of a large number of broadleaf weed species and a small number of grass weeds. A preemergence grass herbicide may be added for additional preemergence grass weed control.

For control of emerged weeds, tank mix with paraquat, Aim or other registered burndown herbicides.

Be sure to check the label for rotational crop restrictions.

The label must be in the possession of the user at the time of pesticide application.

For information about obtaining the label contact: Third Party Registrations, Inc.
